

Check your print system

# Check

your print  
system

Printing is one of the greatest challenges in terminal server environments, virtualized infrastructure and cloud computing systems. Use this handy checklist to ensure all aspects are covered when it comes to making the right decision for your print solution.

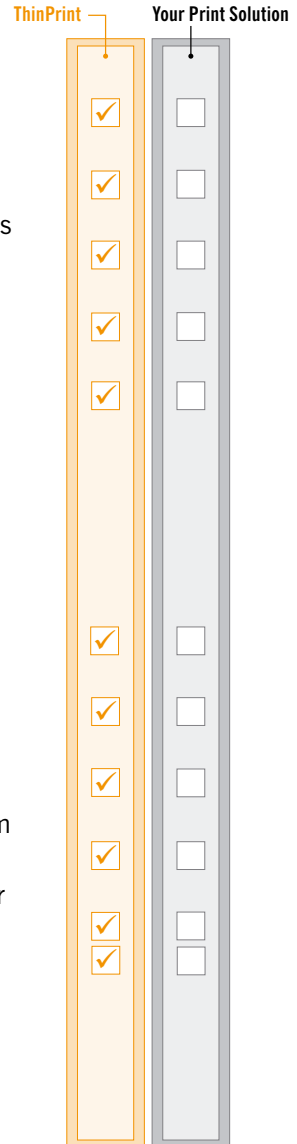

- to print on thin clients and network printers without installing printer drivers on the terminal server?
- to print to a print server share without having the driver of that share installed on the terminal server?
- to integrate printing from SAP servers and mainframes into your terminal server environment?
- to print directly to LPT and COM ports with older applications?
- to control decompression, decryption and delivery using a network appliance?

## Printer Mapping Support

### Does your print solution support ...

- create printers on the terminal server that correspond to printers installed on the client computer?
- fine-tuning of your printer mapping with just one setting?
- choice of printer that should be displayed in the terminal session?
- dynamically create shared printers and assigning them to the correct user context?
- use of wild cards for assigning client printers to server printer drivers?
- assignment of printers via Group Policy?

## Final Questions – Confidence

After assessing your print solution with the help of this checklist, would you say that your print solution ...

- is the market leader?
- has been developed for complex environments within organizations?
- is flexible enough to allow for and follow changes to your IT infrastructure?
