Think ThinPrint

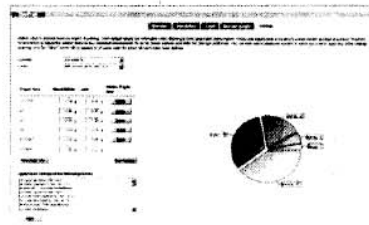

Version 7.0 of the print management solution, ThinPrint, enables analysis of print behaviour in a network and has other innovative features that minimise administrative overheads. ThinPrint's new .print Tracking service enables analysis of print behaviour regarding individual users or user groups, printers, paper formats and other criteria. The data is collected and displayed graphically via a web component.

This provides starting points for planning printer resources, cutting costs and for optimisation of the printing infrastructure. For example, the load could be distributed evenly between different printer models to prevent excessive wear on individual devices and

effectively control the use of models that use expensive consumables.

A new tool, Dynamic Printer Matrix, makes it easier for administrators to provide users with adequate print functionality, regardless of where the users are, what connection they have, or what hardware they use.
